PHASE 2 – REQUIREMENT ANALYSIS

1. Project Title

Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

2. Requirement Analysis

The project requires an automated process for handling Standard Laptop requests in ServiceNow. The system should create and assign a configuration task to the Hardware team after the request is approved.

3. User Requirements

- Users should be able to request a Standard Laptop through the Service Catalog.
- The request should go through an approval process.
- After approval, a configuration task should be created automatically.
- The task should be assigned to the Hardware team.
- The user should be able to track the request status.

4. Functional Requirements

The system should:

1. Accept Standard Laptop requests through the Service Catalog.
2. Trigger the Flow Designer process when the request is submitted.
3. Check the approval status of the request.
4. Automatically create a Catalog Task after approval.
5. Add the required laptop configuration information to the task.
6. Assign the task to the **Hardware** group.
7. Allow the Hardware team to process the configuration task.
8. Update the request/task status during the process.

5. Non-Functional Requirements

The system should:

- Be easy to use.
- Reduce manual work.
- Reduce possible errors.
- Process approved requests efficiently.
- Provide a reliable workflow.

- Improve the efficiency of the IT procurement process.

6. System Requirements

Software Requirements

- ServiceNow
- Flow Designer
- Service Catalog
- Catalog Task

Hardware Requirements

- Computer/Laptop
- Internet connection

7. Input Requirements

The system receives:

- Standard Laptop request
- Request details
- Approval information
- Configuration requirements

8. Output Requirements

The system should produce:

- Automatically created Catalog Task
- Configuration task assigned to the Hardware group
- Updated request/task status

9. Expected Result

After a Standard Laptop request is approved, the system should automatically create a Catalog Task and assign it to the Hardware group for laptop configuration.

10. Conclusion

The requirement analysis defines the main user, functional, non-functional, input, output, and system requirements needed for the project. These requirements will be used in the next phase to design the system.
